

Does your Interior Stonework need to be Cleaned?

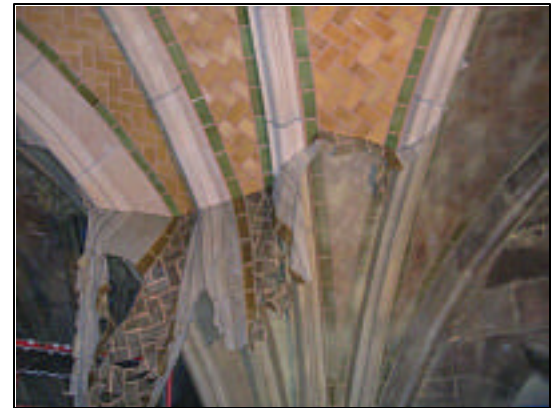

NEW - Virtually Water Free Process!

Interior Cleaning of Stonework

Monaco Restorations, Inc. can clean dirty stonework inside of your building with no dust and virtually no water. Monaco uses a unique "peelable" latex, that removes years of soiling and grime from:

- Brownstone
- Sandstone
- Other Natural Stones
- Flat, Curved or Decorative Surfaces
- Brick
- Terra Cotta
- Concrete

The latex peel an almost odorless latex dispersion that is formulated specially for the internal cleaning of stonework.

During the evaporation of the water, which is present at less than 1% of the product, it polymerizes into an elastic film that adheres to the surface. Active chemicals are bound into the latex which can then be peeled off, often without the need for water.

There are many advantages to using latex peels such as; no chemical aftereffects, free of harsh chemical odors, highly efficient in removing years of soiling, it discourages the migration of salts and due to the absence of water there is no risk of staining.

Using the latex peel Monaco recently completed a 120,000 square foot interior cleaning of the Great Western Staircase located in the New York State Capital of Albany, New York.

Let us come to your facility to do a small sample or mock up, contact Bob Doolin.
